THE SCIENCE CITY

The project mainly is about designing a city that introduces technology and knowledge in all scientific fields to be located in the Administrative District at the New Capital of Cairo.

The main concept was based on the fact that science is divided into three major branches: universe, life, and physical. So the idea was to design a city that introduces knowledge about these three branches in an explorative way.

The science city is divided into three layers that change in height starting from the underground level, till a 60 m high observatory tower. These three levels are connected by a six crawling colored strips that connect the whole city and each strip have a certain theme so that the users can enjoy the six different spatial qualities introduced in each strip.

The spaces between the three building layers creates outdoor spaces that is used for exhibiting large objects or sculptures that wouldn't fit inside the buildings. As well these spaces act as a platform where all the visitors can gather around to communicate.
